SUEZ Platform: Enterprise AI Governance White Paper

A Control Plane for Secure, Governed, and Cost■Aware AI Adoption

ELI5 (Explain Like I'm 5 — With Humor)

Imagine your company discovers AI tools like ChatGPT. Suddenly everyone in the company wants to try it. • Marketing is asking it to write slogans.
• Engineering is asking it to write code.
• HR is asking it to summarize policies.
• Finance is asking it questions about budgets.
• Someone in sales is definitely asking it to write emails at 2AM. Now imagine everyone connects directly to AI providers. That means: • Nobody knows who is using what.
• Someone might paste confidential information into prompts.
• Costs start exploding faster than a popcorn machine in a microwave.
• Security teams begin to sweat. This is where SUEZ comes in. Think of SUEZ as the very responsible adult standing at the door of the AI club. Instead of letting employees run wild on the internet yelling “HEY AI DO MY HOMEWORK”, everything goes through SUEZ first. SUEZ checks: • Who you are • Whether you're allowed to use AI • Which models you're allowed to use • How many tokens you can burn before finance gets upset • Whether you're trying to do something weird In short: SUEZ is the **security guard, accountant, traffic cop, and historian** of your company's AI usage. Everyone still gets to use AI — just without accidentally creating chaos.

Introduction

Artificial intelligence is rapidly becoming a core capability within modern enterprises. From automating workflows to enhancing decision■making and enabling new customer experiences, AI adoption is accelerating across every industry. However, enterprise adoption of AI introduces significant challenges. Organizations must manage security risks, ensure compliance with internal policies, maintain cost visibility, and prevent uncontrolled usage of external AI services. Without proper governance, companies risk data leakage, regulatory violations, and unpredictable operational costs. The SUEZ platform addresses these challenges by providing a centralized enterprise control plane for AI usage. Rather than allowing applications and employees to connect directly to AI providers, SUEZ introduces a governed gateway that manages access, enforces policies, tracks usage, and provides full visibility into AI activity across the organization. This architecture enables enterprises to safely embrace AI innovation while maintaining operational control and governance.

The Enterprise AI Governance Problem

As organizations experiment with generative AI and machine learning services, new operational complexities emerge. Teams frequently connect directly to different providers such as OpenAI, Anthropic, or cloud■native model services. While this approach enables rapid experimentation, it often bypasses traditional enterprise governance mechanisms. Several risks appear quickly: • Shadow AI

usage where employees access AI tools outside IT oversight.
• Lack of cost control due to uncontrolled token consumption.
• Absence of auditing for prompts, outputs, and usage patterns.
• Difficulty enforcing security policies across multiple AI providers. Without a centralized governance layer, organizations struggle to maintain a consistent policy framework across departments and applications.

SUEZ Platform Architecture

SUEZ is designed as a cloud■native, multi■tenant SaaS platform that acts as a secure intermediary between enterprise applications and AI providers. At its core, the platform functions as a governance gateway that evaluates every AI request before it reaches a provider. Each request is authenticated, evaluated against policy rules, metered for billing, and logged for auditing. The architecture typically includes the following major components: API Gateway – Serves as the entry point for applications and enforces authentication and rate■limiting. Policy Engine – Evaluates governance rules such as model permissions, token limits, and provider restrictions. Resource Management – Maintains the lifecycle of AI models, tools, and agent workflows provisioned for each tenant. Agent Runtime – Executes orchestrated AI workflows that combine models and external tools. Usage Metering and Billing – Captures token consumption, tool usage, and agent execution metrics to provide cost transparency. Observability Services – Provide metrics, logs, and tracing for operational visibility.

Security and Compliance

Security is a fundamental design requirement for enterprise AI platforms. SUEZ introduces multiple layers of protection to ensure that AI usage complies with enterprise security standards. All communications occur over encrypted channels using TLS. Authentication integrates with enterprise identity providers such as SSO, OAuth, or OpenID Connect. Each tenant environment is logically isolated to prevent cross■tenant data exposure. Policy enforcement ensures that users can only access approved AI models and tools. Additionally, prompt size limits and provider restrictions can be enforced to prevent unauthorized data transmission. Audit logs capture all AI requests, enabling compliance teams to review how AI systems are being used within the organization.

Operational Benefits

Deploying a centralized AI governance platform offers several strategic advantages. First, organizations gain complete visibility into AI usage across teams and applications. Executives and platform administrators can track model usage, cost patterns, and adoption trends. Second, enterprises can enforce consistent governance policies across all AI providers. This eliminates the complexity of managing provider■specific security configurations. Third, cost control becomes predictable. By metering tokens, tool invocations, and agent execution steps, organizations can monitor AI expenses in real time and allocate costs to specific teams or projects. Finally, the platform enables safe experimentation. Developers can integrate AI capabilities into applications while the platform automatically handles governance, auditing, and billing.

Conclusion

Artificial intelligence will become a foundational capability across enterprise software systems. However, successful adoption requires more than simply connecting to AI APIs. Organizations must establish governance frameworks that ensure security, compliance, and operational transparency. The SUEZ platform provides this missing layer by acting as a control plane for enterprise AI consumption. By centralizing policy enforcement, resource management, and usage metering, the platform enables organizations to scale AI adoption responsibly. With platforms such as SUEZ, enterprises can move beyond experimental AI usage and transition toward a secure, governed, and sustainable AI ecosystem.
